

Vision

MANA SIYO · WHERE THIS IS GOING

THE NORTH STAR

Mana Siyo is a manufacturing entity. The work doesn't end at a render — it ends at a garment, cut and sewn, on a body. Maya is the front door: the place where a client articulates what they want, sees it visualized with their own face on it, hearts the version that's right, and submits. Everything past that is fabrication.

THE FULL PIPELINE

#	STAGE	WHAT HAPPENS
01 Listen	Voice consultation	Maya captures the client's intent in their own words — silhouette, mood, fabric feel, the things they're trying not to look like.
02 Visualize	Three-view atelier render	Multi-anchor identity preservation. The client sees themselves wearing the garment from side, front, back — same face, same body, same height.
03 Refine	Modify / Re-cut / Iterate	In-place edits to the same vision; fabric swaps without changing the silhouette. Identity holds across every iteration.
04 Submit	Save to Clients folder	The hearted version becomes the canonical design. One-pager PDF, summary, transcript, moodboard, and source inspos all bundled.
05 Pattern	Render → accurate pattern (future)	Maya dissects the three-view render into a flat sewing pattern — panels, seam allowances, dart positions, grainline, all measured against the client's body.
06 Cut	Pattern → laser cutter (future)	The pattern files feed directly to the laser cutter. Fabric is cut to spec without manual translation.
07 Sew	Atelier assembles	Cut panels are constructed into the finished garment by the atelier team using the same one-pager as the build spec.
08 Deliver	Bespoke piece, on a body	The garment that started as words ends as a wearable thing. Maya's role is over by step 4; everything after is Mana Siyo making it real.

WHAT MAYA BECOMES

Maya doesn't stay a render tool. As the pipeline extends into manufacturing, Maya becomes the bridge between language and machine. She holds the spec — every fitting note, every fabric choice, every modification — in a form the laser cutter understands. She closes the loop between what a client said in a room and what the cutter reads off a file.

WHY THIS MATTERS

Bespoke fashion is currently bottlenecked by translation. A consultation becomes a sketch becomes a pattern becomes a cut becomes a fit becomes a sample becomes a final. Each translation loses information and adds weeks. The vision is to compress all of that into one continuous pipeline where the client's words and the fabric's grain are part of the same record. Maya is the system of record.

THE SHAPE OF THE BUSINESS

ROLE	WHAT THEY DO
Client	Speaks, sees themselves rendered, hearts a version, submits.
Maya	Captures, visualizes, locks identity, exports the spec.
Atelier	Receives the submitted spec, cuts pattern, sews garment.
Manufacturing	Laser cutter + cut-to-sew workflow driven directly by the spec file.
Output	A finished garment, bespoke to one person, made from words.

THE MOODBOARD-AS-FACTORY

The moodboard isn't a sketchpad. It's the first floor of the factory. Everything that lands there is moving toward a cut.
